

Global Warming

Seven students argued about what they thought were major human causes of global warming. This is what they thought were causes that could be attributed to humans:

Maria: acid rain

Natalie: burning coal

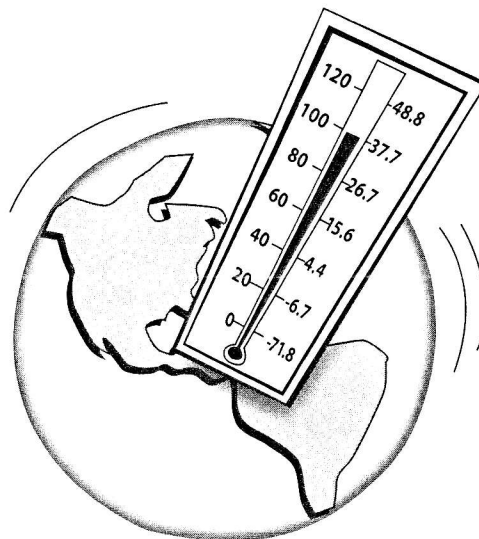

Tessa: the fuel we use in our cars

Blaine: using leaded gasoline instead of unleaded

Anita: toxic chemicals in air pollution

Raul: the thinning of the Earth's ozone layer

Van: water pollution

Circle the name(s) of the student or students you agree with. Explain why you agree.

I agree with Natalie because CO₂ releases CO₂, which thins the ozone layer, which allows more UV light in. I agree with Tessa because gasoline is a fossil fuel. Fossil fuels come from dead things, which contain carbon. Therefore, fossil fuels release CO₂. I agree with Anita because toxic also thin the ozone layer. And I agree with Raul because thinning the ozone layer lets more light in, warming the Earth.
